/chee/:

the circulating life force

The energy conservation law states that energy can neither be created nor destroyed - only converted from one form of energy to another. Energy is essential for life. It is a source that we use to provide light and heat, or to power machines. But we also talk about energy as something that can be given or taken, or as a characteristic we assign to ourselves or people in our social circles.

We want to make these energy transactions more visible and tangible. We invite you to experience various energy transformation processes and hope to encourage reflections and awareness toward energy consumption.

What is your current state?
